

Order Management PRD - demo-bank

Sample product requirements document bundled with the server seed (SPEC T3).

Section: Order list (#list)

The dashboard shows the user's recent orders in a table with columns id, amount and status. Every rendered row must match exactly one record from the backend order service; the UI must never invent or drop orders.

Section: Order detail (#detail)

Selecting a row opens the order detail view showing the same id, amount and status as the list, plus a timestamp of the last synchronization.
